

Lab 5 Summary

Yuichi Hamamoto

During this lab, I learned how each scheduling algorithm works. First come first and shortest-remaining time were simple enough to understand during the lecture but I actually did not know how exactly round robin is implemented before I started working on this lab. As I researched about the algorithm, I found that there are so many different algorithms and there are many ways to implement each algorithm. I found that it is hard to decide which algorithm is better because it depends on the size of process and type of process. If I have time, I would like to google for when it uses which algorithm and why.
